# Project Overview

## Cell3Ditor

- Call year: 2015
- Call topic: FCH-02.6-2015: Development of cost effective manufacturing technologies for key components or fuel cell systems
- Project dates: 01/07/2016 - 30/04/2020
- % stage of implementation 01/11/2019: 100 %
- Total project budget: 2,191,133.75 €
- FCH JU max. contribution: 2,180,662.50 €
- Other financial contribution: 0 €
- Partners: DANMARKS TEKNISKE UNIVERSITET (DTU), FRANCISCO ALBERO S.A. (FAE), 3DCERAM (3DCERAM), Promethean Particles Ltd. (PROM), University of La Laguna (ULL), SAAN Energi A.B. (SAAN), HyGear Fuel Cell Systems B.V. (HFCS) and FUNDACIO INSTITUT DE RECERCA DE L'ENERGIA DE CATALUNYA (IREC)

# Project Summary

# Cell3Ditor

## Objective

Development of 3D printing technology for the industrial production of **SOFC parts and stacks**.

### Intermediate goals

- Printable inks and slurries
- Multi-material ceramic 3D printer
- Single-step sintering
- Enhanced parts

## Global positioning vs SoA

<u>Cell3Ditor</u>	<u>State-of-the-art</u>
• Multi-material ceramic 3D printer	N/A
• Printable inks and slurries of advanced ceramics	N/A
• 3D printed SOFCs	N/A

## Application and market area

Commercial segment of the stationary fuel cells market

- Huge potential
- Highly heterogeneous

Selected target market: Europe

CDF simulation of the SOFC stack

SOFC stack CAD design

3D printing of the SOFC stack

Single-steps sintering

Complex SOFC geometries and self-supported stacks

# Project Progress-Printable functional ceramics

## Achievement to-date

Functional ceramic powders or precursors

Printable inks & slurries

### Fully printed SOFC cells

### Proof-of-concept

#PRD2020  
#CleanHydrogen

Commission I

# Risks, Challenges and Lessons Learned

## Printable inks/slurries

### Risk

- UV-absorbing materials

### Mitigation

- Photo-thermal curing

## Multi-material 3D printing process

### Risk

- Multi-layer architectures

### Mitigation

- Laser machining

## Single-step sintering

### Challenges

- Cosintering

### Risk

- Compatibility of dense and porous structures

### Mitigation

- Add porous former

## 3D printing of SOFCs

### Risk

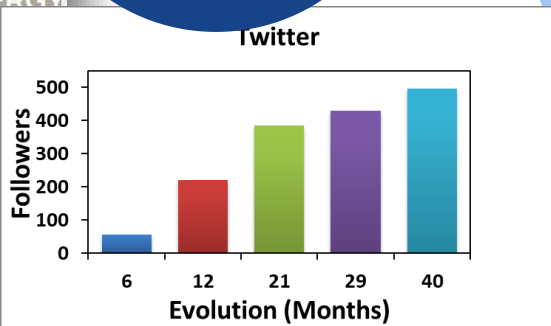

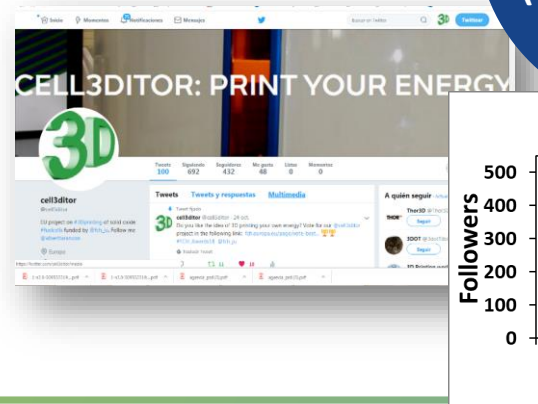

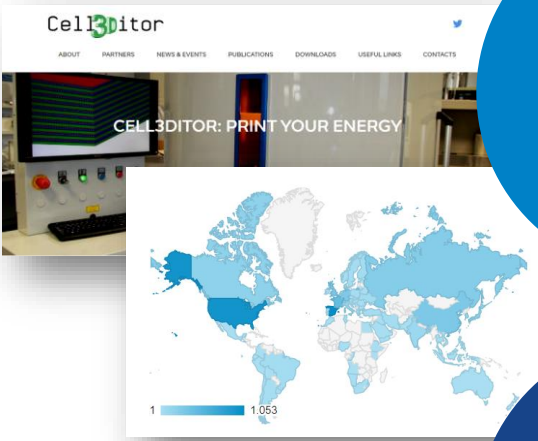

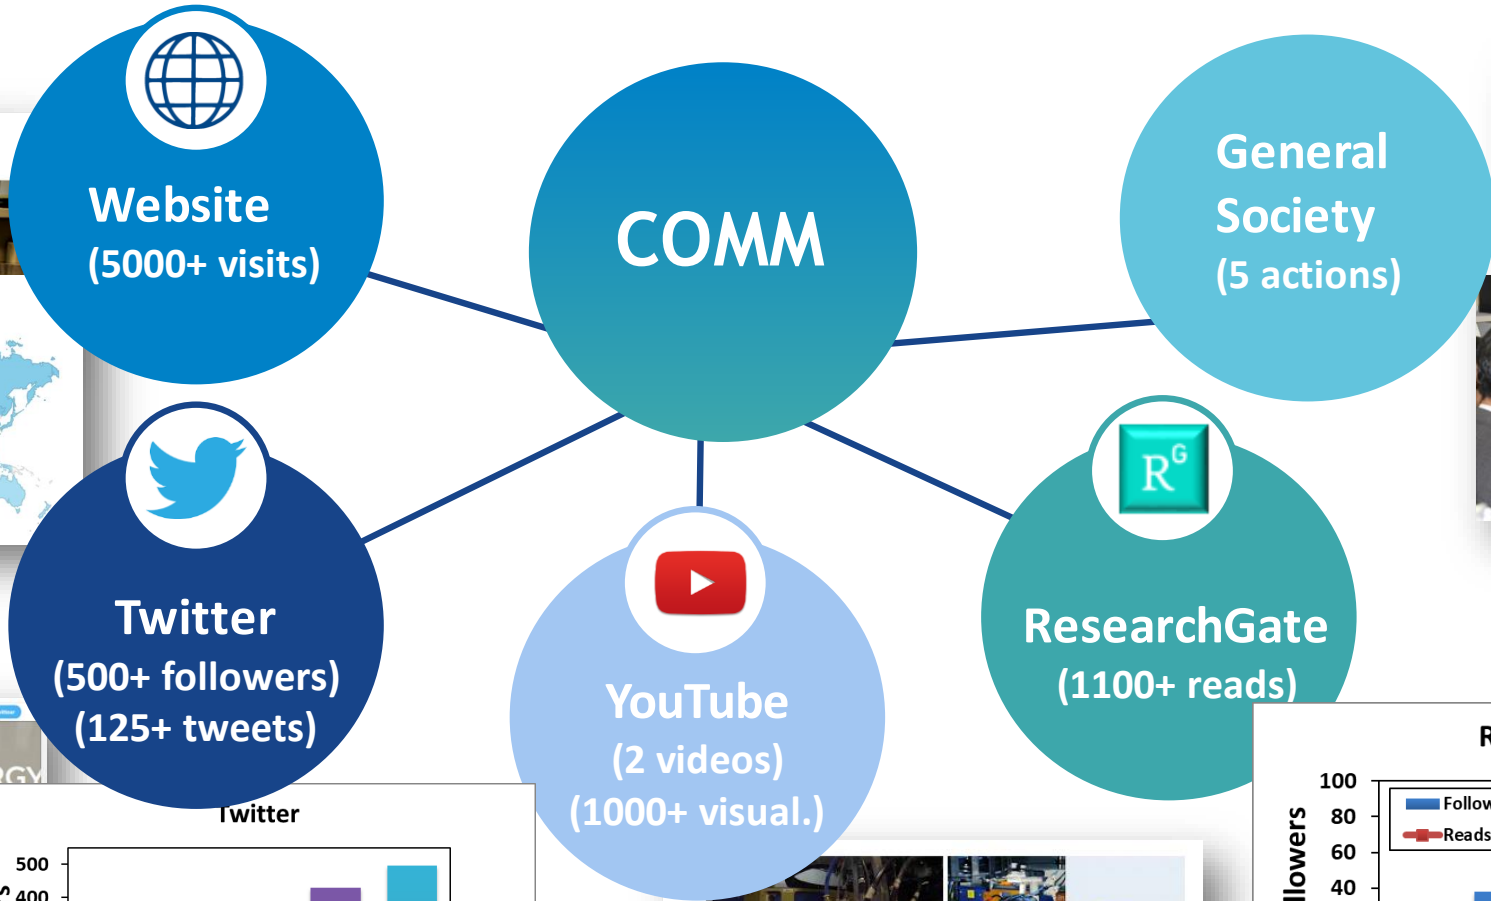

- Low yield of inkjet
- Small fluidics (cleaning)

### Mitigation

- Robocasting
- Sacrificial material

Energy & Environmental Science

Three dimensional printing of components and functional devices for energy and environmental applications

J. C. Ruiz-Monales, A. Tarancón, J. Canales-Vázquez, J. Méndez-Ramos, L. Hernández-Alonso, P. Acosta-Mora, S. Martín-Becerra and R. Fernández-González

Three-dimensional printing technologies represent a revolution in the manufacturing sector because of their unique capabilities for increasing shape complexity while reducing waste, material, capital cost and design for manufacturing. However, the application of 3D printing technologies for the fabrication of functional components or devices is still an almost unexplored field due to their visual complexity from the materials and functional points of view. This paper focuses on reviewing previous studies of three-dimensional printing technologies for energy and environmental applications.

60+

**Highlights**

**Best Innovation FCH JU 2018**

# Impact

## • Industry:

- 4 Patent applications.

Code	Concept
B18678 EP/US/JP/KR/RU/CN/FR/UA	HYBRID PRINTING PROCESS
B20377 EP/US/JP/KR/RU/CN/FR/UA	SACRIFICIAL MATERIAL APPROACH
B20887 EP/US/JP/KR/RU/CN/FR/UA	MULTIMATERIAL PRINTING
EP 19382509	SOFC NEW CONCEPT

- Outputs generated within the project already in the partners portfolio:

- Ceramic nano-dispersions: Promethean Particles Ltd.
- Extension of ceramic pastes in catalogue: 3DCERAM
- Multi-material 3D printer: 3DCERAM

## • Environmental:

- LCA and technoeconomical assessment:
  - Reduction of waste material
  - Reduction of energy consumption

## • Social:

- Growing awareness about 3D printing for energy
- Influence policy makers

*Cerame-Unie Conference Brussels, November 2017*

*Article devoted to Cell3Ditor exposed at the Bilbao Fair 2017*

*Cell3Ditor activities at the National Science Days*

# Exploitation Plan

- **Protection of the IPR:** development of a Plan of Use and Dissemination of Foreground (**PUDF**), application for patents and adoption of a 'protecting before disseminating' policy.
- **Exploitation of outputs:** generation of specific **business plans** for exploitable outputs (assessed by SSERR and Innovation Radar).

- **Actions to deploy the exploitation plan:**
